

OCEAN DYNAMICAL DOWNSCALING FOR SEA-LEVEL CHANGE

Tim Hermans – UK Sea Level Workshop

Why dynamical downscaling?

- Global climate models used to project ocean dynamic sea-level change
 - Limited horizontal & vertical resolution
 - No tides
- Refine using a regional model

Historical performance

Observations:

(b) OSTIA

(h) GCM-MPI

(d) GCM-HAD

(j) RCM-MPI Downscaling

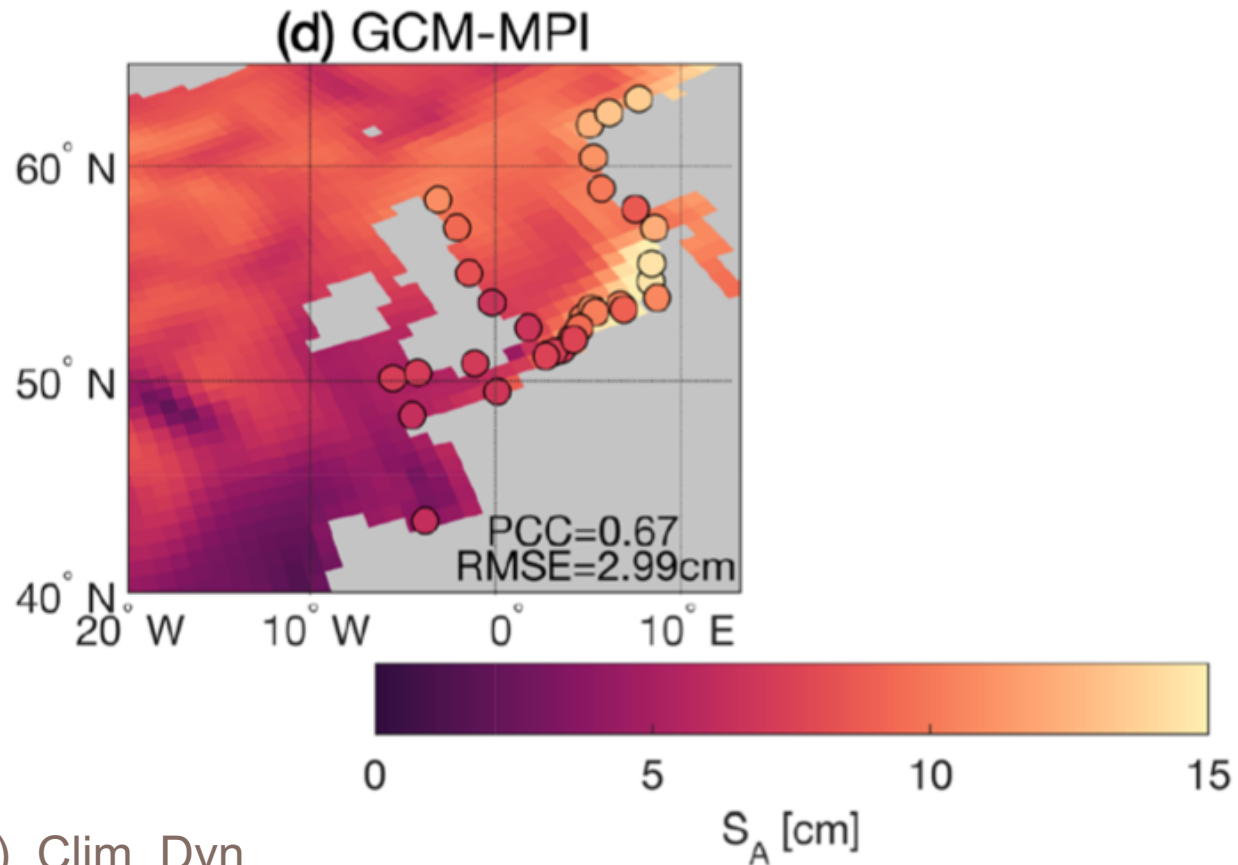

(f) RCM-HAD

Historical performance

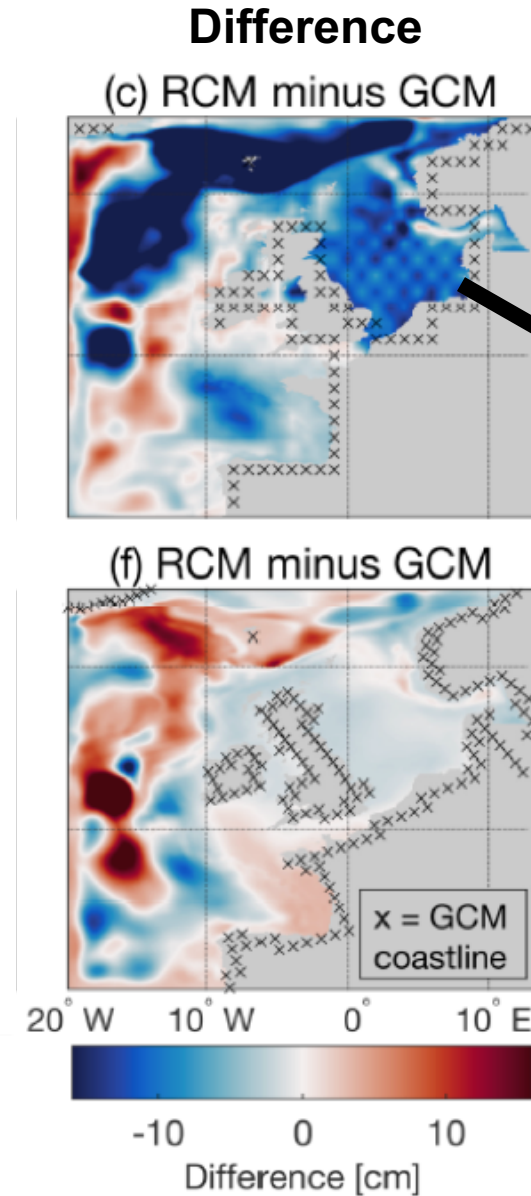

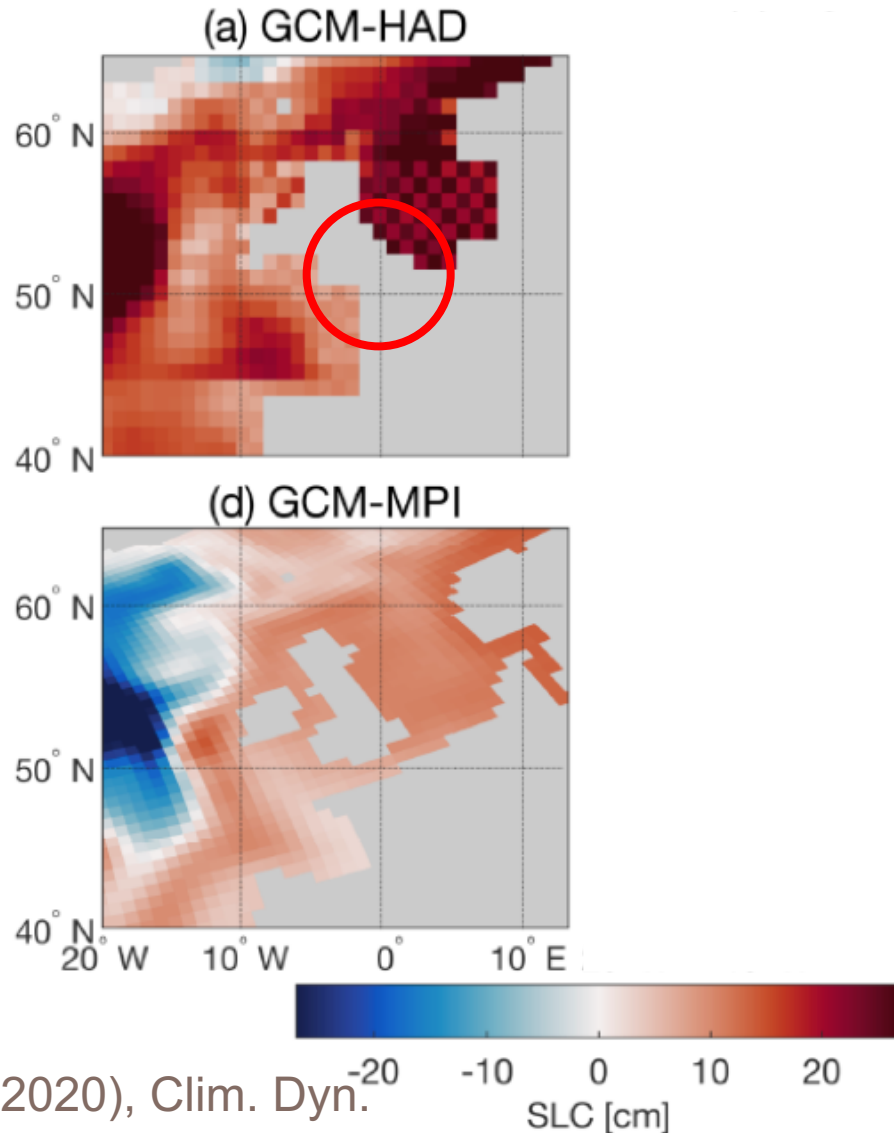

- Amplitude of the seasonal sea-level cycle S_A

— Downscaling →

Effect on sea-level projections

Downscaling →

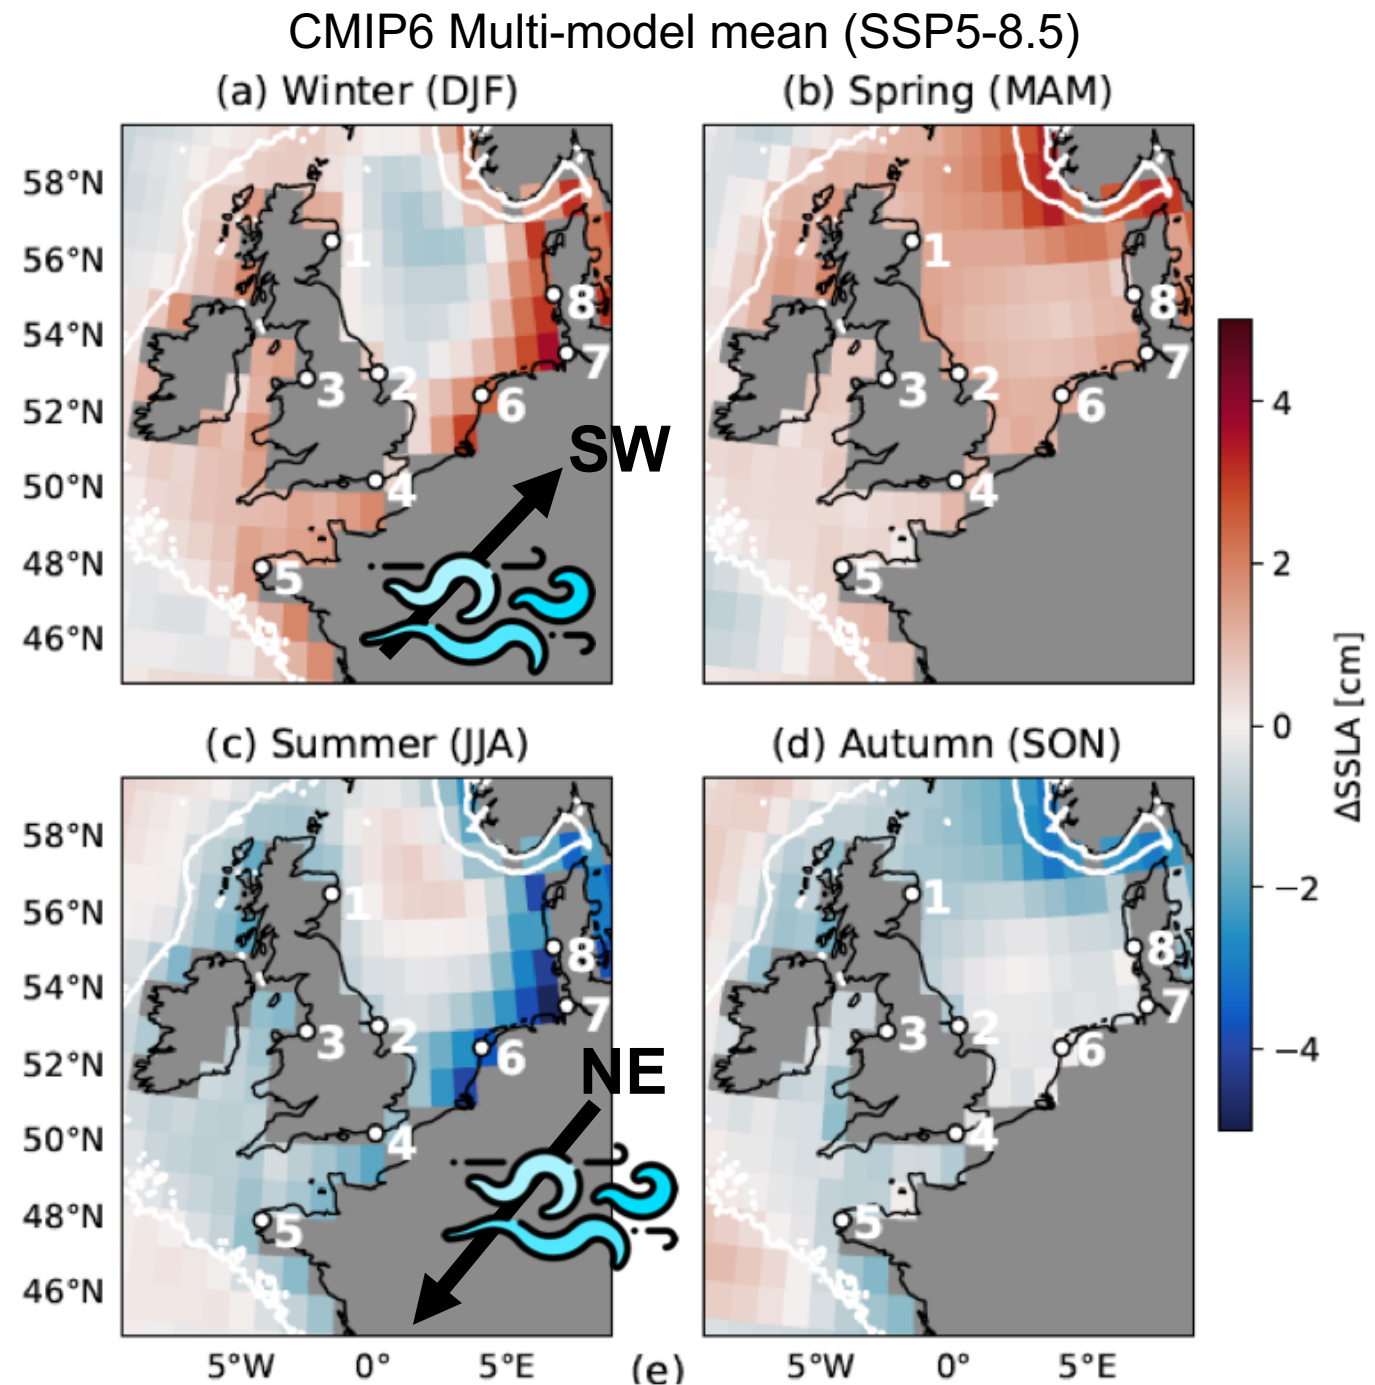

Mainly due to halosteric & bottom pressure change differences

RCP8.5

Seasonal sea-level change

- Seasonal **relative** to annual mean change
- Effect of a closed English Channel

Discussion & Conclusions

Dynamical downscaling for regional sea-level projections?

Challenges:

1. Ensemble size

- Time-slice methods, downscaling ensemble mean?
- Data availability
- Which models?

2. Evaluating performance

- Historical ↔ Future
- Model selection/weighing

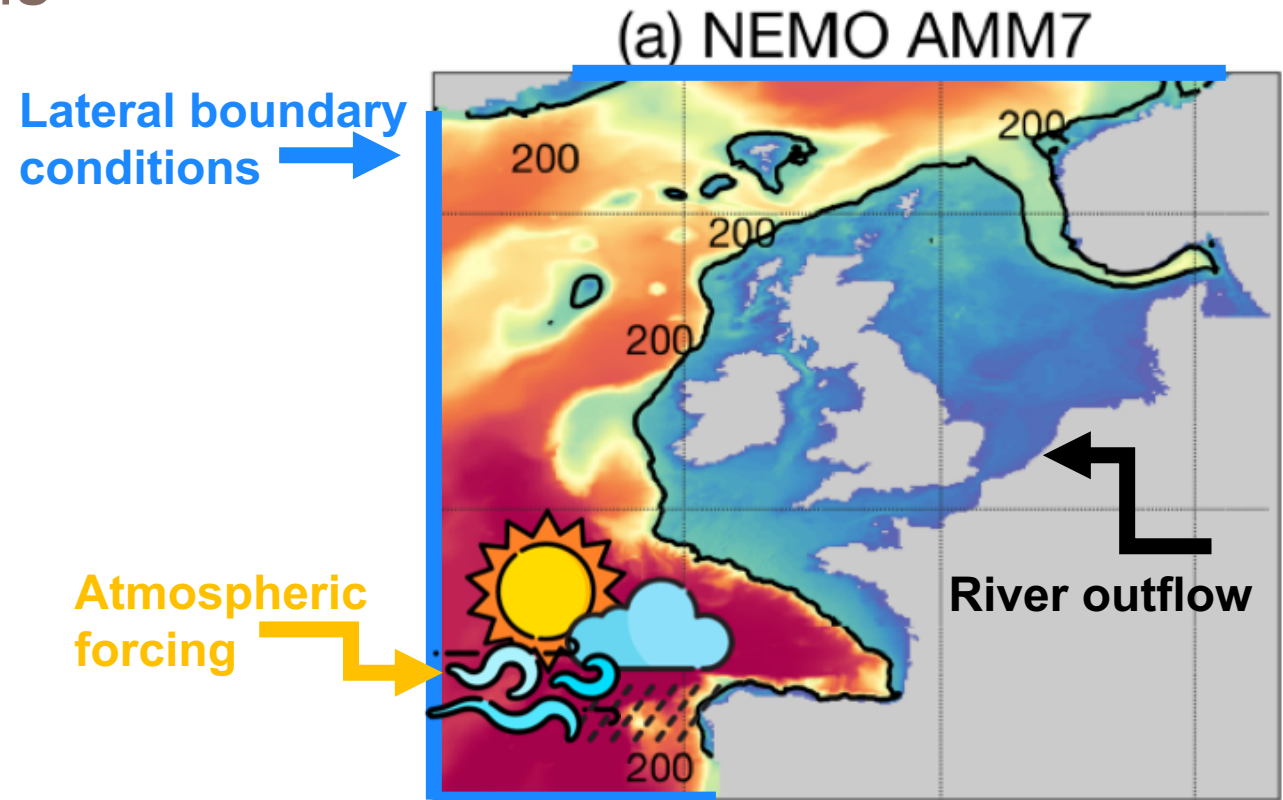

3. Uncertainty due to downscaling set-up

Bonus:

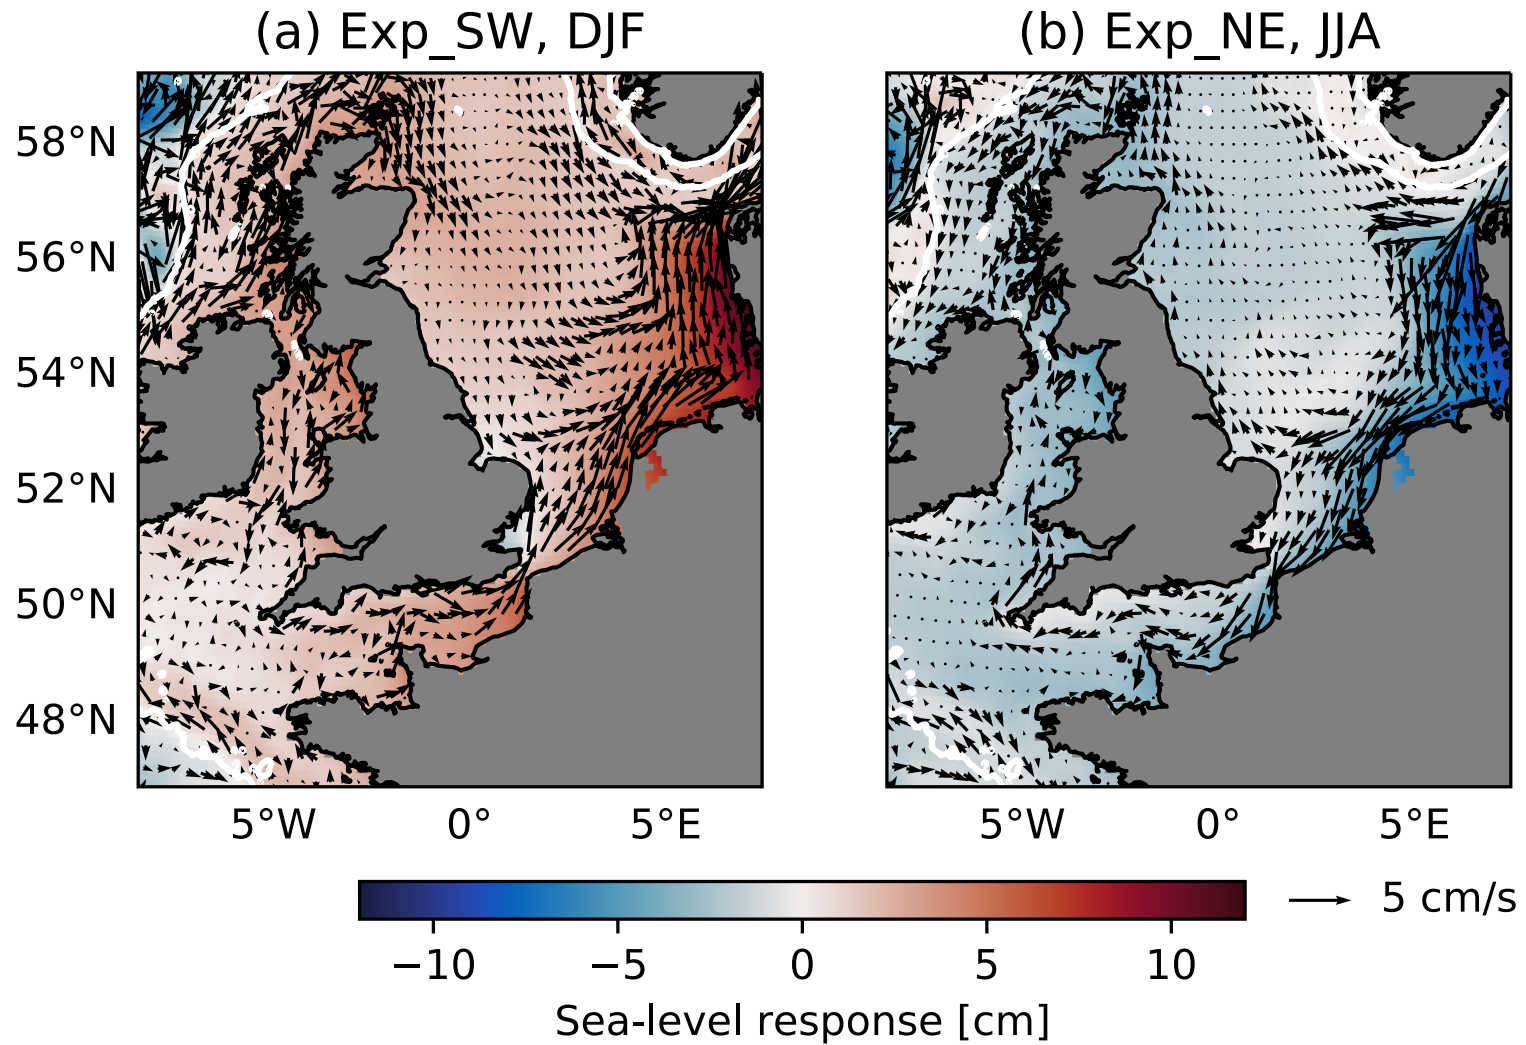

Dynamical downscaling: sensitivity experiments

- Modifying the boundary conditions
- Using reanalysis forcing
 - Hermans et al. (2020), JGRo
- Using HadGEM3-GC3.0
 - Tinker et al. (2020), Clim. Dyn.
- Long-term integration
 - Jin et al. (2021), JCLim (marginal seas China)
